## Initial remarks

This document includes implementation of the stipulations of the Polish and the European Union (EU) legislation in connection with the obligations imposed on the Institute of Agriculture Economics and Food Economy (IAEFE) when implementing the tasks of the Farm Accountancy Data Network (FADN).

The tasks of IAEFE are specified in the Act of 29 November 2000 on agriculture accountancy data network (J. of L. of 2001 No. 3, item 20 as amended) and in Commission Regulation (EC) No 730/2004 of 19 April 2004 adapting Regulation (EEC) No 1859/82 concerning the selection of returning holdings for the purpose of determining incomes of agricultural holdings by reason of the accession of the Czech Republic, Estonia, Cyprus, Latvia, Lithuania, Hungary, Malta, Poland, Slovenia and Slovakia to the European Union.

The purpose of the study is to present rules for creating a sample of agricultural holdings to determine incomes under FADN representative survey.

The study has been produced in IAEFE in extensive cooperation with the Central Statistical Office (CSO) employees as regards classification of agricultural holdings and a tabular analysis of general population and the field of observation.

The results of projects financed by the European Commission and the Government of the Republic of Poland as regards the division of the territory of Poland into regions and calculating the Standard gross margin (SGM) are used in the study.

All calculations used for the production of the selection plan have been carried out in IAEFE on the basis of the data made available by CSO from the Common Agricultural Census 2002.

## Description of agricultural holdings population<sup>1</sup>

The Common Agricultural Census (CAS) was carried out in the period 21.05-08.06.2002 according to the state as of 20.05.2002 at midnight. The census included: individual agricultural holdings where the arable land covered over 0.1 ha; physical persons who were owners of farm animals with no arable land or with arable land of less than 0.1 ha area, and farmlands used by legal persons and organisational entities having no legal personality.

The purpose of CAS was, amongst other things, to provide basic information on agricultural holdings, deliver necessary data so that Poland could meet the obligations towards international organisations, and to create (and update) surveys for choosing samples in representative tests by means of a random selection.

The subject scope was consistent with the scope of Farm Structure Survey (FSS), which *inter alia* made it possible to carry out a classification of agricultural holdings according to the relevant EU legislation.

### Applied definitions of agricultural holdings:

An **agricultural holding** means cropland and forestland, buildings or parts of buildings, equipment and livestock, if they are or can be an organised farm whole, together with rights and obligations connected with running such agricultural holdings.

An **individual agricultural holding** means an agricultural holding which covers 0.10 ha or more, of arable land which is owned or used by a physical person or persons.

An **owner of farm animals** means a person who does not have arable land or a person whose arable land covers less than 0.10 ha, who has at least: 1 representative of cattle or (i) 5 pigs or 1 sow or (i) 3 sheep or goats or (i) 1 horse or (i) 30 representatives of poultry or (i) 5 female furred animals (including rabbits) or (i) 1 beehive.

## Division of Poland into SGM regions

Under Phare 2000 No PL0006.09.06 "Preparation and implementation of selected Common Agricultural Policy (CAP) mechanisms - Technical Assistance (FADN)" Poland was divided into SGM regions in order to introduce a Community typology of agricultural holdings operating in Poland.

Bearing in mind the fact that gross margin is a methodological base to specify standard gross margin, factors which determine production effects obtained by agricultural holdings have become a part of criteria for the division of farm regions. Another applicable assumption for the division of SGM

---

<sup>1</sup> The chapter has been prepared on the basis of: Report of the results of the Common Agricultural Census 2002, CSO, Warsaw 2003.

---

regions was preservation of territorial compactness of the regions. Furthermore, on the basis of a recommendation conveyed at workshop on FADN in Brussels on May 2000, a rule for delimiting SGM regions in such a way as to preserve the territorial compactness of the regions at a minimal level, determined by NUTS 3 was adopted.

At that time Poland was divided into territorial units which were comparable to those applied in the European Union<sup>2</sup>. Following the Commission's recommendation, the minimal level for delimiting SGM regions in Poland is a union of *poviats* (NDP 3). However, taking into account the access to statistical data, it was decided to delimit SGM regions according to the borders of NDP 2 units, which, in case of Poland, are voivodeships.

To establish homogeneous regions as to determine SGM, 7 statistical parameters which describe factors indicating production effects of agricultural holdings were applied, namely:

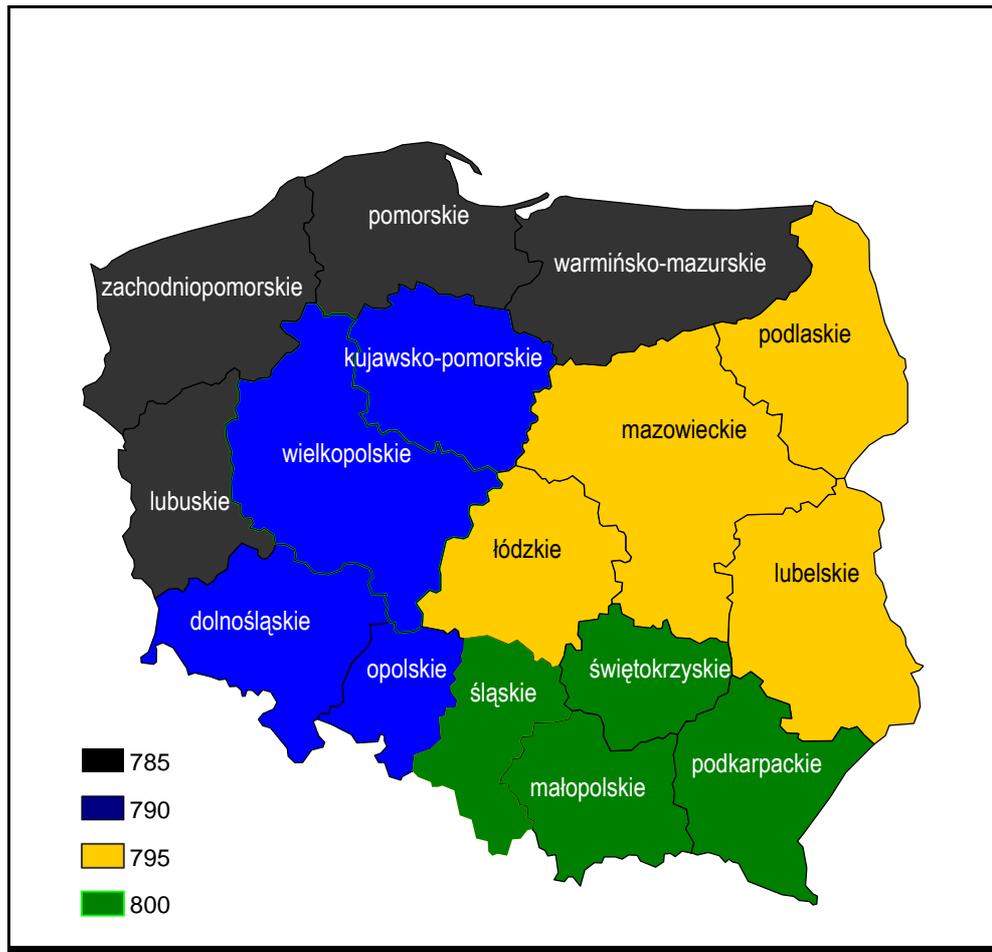

1. Arable land area in an average individual farm in 1996.
2. Percentage contribution of the permanent grassland in arable land in the total farm sector in 2001.
3. A number of dairy cows in an average individual farm (on average in the period 1999-2001).
4. A number of pigs in an average individual farm (on average in the period 1999-2001).
5. Grain crops in total farm sector (on average in the period 1999-2001).
6. Annual milk production from one cow in total farm sector (on average in the period 1999-2001).
7. NPK use per kg in 1 ha of arable land in total farm sector in 2001.

Basing on the analysis of deviations of the listed parameters and having the preliminary assumption on the maximum number of regions, it has been stated that the divisions lines for 4 regions go along the borders of NDP 2 districts, i.e. voivodeships, and each region includes 4 districts of NDP 2 (4 voivodeships each).

---

<sup>2</sup> The Order of the Council of Ministers of 13 July 2000 on the introduction of Terminology for Territorial Units for Statistical Purposes (NDP) (J. of L. 2000 No. 58 item 685).

Map 1 Division of Poland into SGM regions

General characteristics of the regions:

**Region (785) - Pomorze and Mazury** - very big agricultural holdings, medium level of production intensity, the region is characterised by the biggest stock of dairy cows and is second as regards the stock of pigs in agricultural holdings.

**Region (790) - Wielkopolska and Śląsk** - big agricultural holdings, very intensive production as the use of mineral fertilisers is the highest and grain crops are the biggest, there is also the highest milk production of cows (the stock of dairy cows - the second place) there and the region has the biggest stock of pigs in agricultural holdings.

**Region (795) - Mazowsze and Podlasie** - medium agricultural holdings, medium level of production intensity, the region is second as regards the stock of dairy cows in agricultural holdings.

**Region (800) - Małopolska and Pogórze** - small agricultural holdings, low level of production intensity (the parameters of all the measured features are the lowest), the region is characterized by highly dispersed and tiny agricultural holdings.

---

The table below includes codes used in identification of the region.

Table 1 SGM and FADN regions in Poland

Region name	National Code	FADN Code
Pomorze and Mazury	A	785
Wielkopolska and Śląsk	B	790
Mazowsze and Podlasie	C	795
Małopolska and Pogórze	D	800

## Applied classification of agricultural holdings

By Commission Decision EEC/85/377 (OJ L 220 17.08.85 p.1) the EU established a uniform typology of agricultural holdings in all Member States. It is used both to present the results of analyses and to establish a sample for representative survey and next to implement the results.

In the applied terminology, the economic size unit is specified on the basis of the farm standard gross margin. The agricultural holding type is specified on the basis of contribution of particular standard gross margins from particular agricultural activities (e.g. wheat, pigs) to creation of standard gross margin of an agricultural holding.

The classification consists in grouping of similar agricultural holdings into classes (types) at a higher or lower level of aggregation. The agricultural holding economic size unit is specified on the basis of SGM absolute value of an agricultural holding and is expressed in ESU<sup>3</sup>. It is calculated by way of dividing of standard gross margin of an agricultural holding by one ESU value, applicable in a given year and expressed in Euro, as one ESU value is a fixed Euro number, which is established and updated on a yearly basis by the European Commission according to the indicator of changes in the EU agriculture.

SGM coefficients are calculated periodically on the basis of medium data of three consecutive years in delimited regions of Member States. The European Commission establishes the list of agricultural activities for which calculation of SGM is required. At present the list includes about 100 activities.

SGM coefficients for an agricultural holding is calculated by way of totaling up of multiplied SGMs of particular activities by their size (e.g. the number of wheat hectares x SGM of wheat).

For the needs of agricultural holdings classification in Poland, standard gross margins, calculated in IAFE in cooperation with experts from the Institute of Crop Fertilisation and Soil Science, Warsaw Agricultural University and IAFE were used. The calculation was made for four delimited SGM regions in Poland. The standard gross margin – SGM"2000" coefficients were calculated for 35 plant production activities and 23 animal production activities. The table below presents a list of activities for which standard gross margins were calculated.

---

<sup>3</sup> ESU = European Size Unit.

Table 2 List of activities for which standard gross margins were calculated for the needs of the Community typology

FSS Code	Unit	Label
D01	ha	Common wheat and spelt

J16D	100 heads	Other poultry
J17	head	Rabbits (breeding females)
J18	hive	Beehives

The table below presents a list of classes which economic size units were divided into. In relation to the EU classification, the last "Union" class has been extended and further divided into four classes.

**Table 3** The list of applied economic size units

Class Code	ESU
ES 2	2 ≤ 4
ES 3	4 ≤ 6
ES 4	6 ≤ 8
ES 5	8 ≤ 12
ES 6	12 ≤ 16
ES 7	16 ≤ 40
ES 8	40 ≤ 100
ES 9	100 ≤ 250
ES 10	250 and more
ES 11	250 ≤ 500
ES 12	500 ≤ 1 000
ES 13	1 000 ≤ 1 500
ES 14	1 500 and more

The typology algorithm was established in IAEFE on the basis of relevant EU regulations (Commission Decision EEC/85/377 (OJ L 220, 17.08.1985 p. 1 - 32)). In 2003 this algorithm was used for the classification of agricultural holdings on the basis of Common Agricultural Census 2002 data.

The table below presents a list of types used in the classification of agricultural holdings.

## Rules for establishing the observation field

Out of 2 933 228 objects registered in Common Agricultural Census 2002, 2 172 205 agricultural holdings declared running agricultural activities. Such agricultural holdings were classified according to the EU rules. The economic size unit and agricultural type were calculated for 2 139 784 agricultural holdings (the remaining ones did not run activities, for which SGM was calculated).

The minimal threshold which classifies an agricultural holding to be a commodity agricultural holding (it means inclusion of the agricultural holding in a survey) is expressed in ESU. This size unit is established for each Member State separately and changes in time, depending on the existing agrarian structure and economic strength of agricultural holdings.

The threshold is established in such a way as to include in the analysed population, agricultural holdings which produce at least 90% of standard gross margin of agricultural production in a Member State. In case of Poland, the threshold was established for 2 ESUs (see: Tabela 7), which ensured covering 89,3% of SGM. This threshold was exceeded by 745 023 agricultural holdings.

For converting of SGM expressed in PLN into ESU, the PLN exchange rate -> Euro was used in the amount of 3,96822 and Euro 1 200 per 1 ESU. Euro exchange rate was calculated as the average from three years (1999-2001)<sup>4</sup>.

The table below shows basic parameters which characterise the observation field against the background of the general population. Agricultural holdings included in the observation field have at their disposal over 80% of arable land, and over 90% of convertible animals<sup>5</sup> are kept there. At the same time only about 62% of the workers measured in AWU<sup>6</sup> are employed there. It has to be stressed that only about 35% of agricultural holdings were included in the observation field. It shows that the production of agricultural holdings in the observation field is highly concentrated and the production of the remaining "agricultural holdings" is significantly dispersed. It is hard to call them agricultural holdings because the production is of a self-supply nature and it virtually does not contribute to the agricultural production in Poland.

Table 8 Basic parameters characterising the observation field against the background of the general population

Characteristics	Unit of measurement	General population	Observation field	Observation field contribution to general population in %
Standard gross margin	PLN thousand	36 484 291	32 569 845	89.27
Arable land area	ha	15 092 889	12 011 402	79.58

### ***Basic characteristics according to regions***

Comparison of data included in the tables of this chapter provides interesting observations connected with the division of the number of agricultural holdings and standard gross margin in particular regions. Special attention shall be paid to Małopolska and Pogórze regions. The observation field covered about 17% of agricultural holdings producing about 66% of standard gross margin. Agricultural holdings in that region are dispersed and tiny, and the level of production is low. Getting ahead of the course of this study, it is worth noting that the contribution of a sample from that region to the Poland wide sample is only about 12%. Agricultural holdings from Małopolska and Pogórze regions are not only dispersed and tiny, but also very similar. Thus, using Neyman's optimal allocation (which applies the changeability of agricultural holdings), the sample from that region is so small-numbered.

Table 9 Standard gross margin in region 785 in zloty

## Rules for creating the representative sample

FADN deals with representative surveys, which means *inter alia* that the surveys are conducted on a randomly selected sample of agricultural holdings. To reflect the diversity of agricultural holdings in the best way, a method of estimating the sample prepared by the Polish statistician, Jerzy Neyman, so-called an optimal allocation was used. To this end, the observation field was divided, taking into account 3 criteria:

- geographical location - regions;
- economic size unit - classes of economic size units;
- agricultural type.

The sample size was established to cover about 12 100 agricultural holdings by way of negotiations with the European Commission. This means that the sample includes about 1.6% of the observation field (12 100 x 100 / 745 023).

After the sample size is established on the basis of changeability, the specimen sizes from particular layers are specified. The total number of specimens is the sample.

The Neyman's method was applied in its pure form. Application of standard deviation of only one characteristic, i.e. standard gross margin, was used in order to assess changeability. The formula applied has the following form:

$$n_i = n \times \frac{N_i \times \sigma_i}{\sum N_i \times \sigma_i}$$

where:

- n - number of agricultural holdings in the sample;
- i - number of the consecutive layer;
- n<sub>i</sub> - number of agricultural holdings in i/layer;
- N<sub>i</sub> - number of agricultural holdings in the observation field;
- δ<sub>i</sub> - standard deviation of standard gross margin in i/layer.

The most important feature of the applied method is the fact that the sample is in fact a sum of samples from particular layers.

Due to very large differences in changeability between classes of low economic size units and those of high economic size units, the observation field was divided into two groups: up to 100 ESUs and over 100 ESUs. Hence, the following sample sizes were established for the separated groups: 11 800 and 300 agricultural holdings.

A standard error of the average was calculated for both "samples" (it was respectively 94.2031 and 33 409.4384) according to the formula:

$$\sigma_{\bar{x}} = \sqrt{\frac{1}{n} \times \left( \frac{\sum N_i \times \sigma_i}{N} \right) - \frac{\sum N_i \times \sigma_i^2}{N^2}}$$

## **Structure of the sample of agricultural holdings under the Polish FADN**

The tables present the structure of the sample in particular regions and generally in Poland.

## Calculated weights

After the size of the sample of agricultural holdings was established, the weights (how many agricultural holdings from the observation field represented one agricultural holding in the sample) were calculated according to the formula:

$$w_i = \frac{N_i}{n_i}$$

where:

$w_i$  - weight of an agricultural holding in  $i$  layer.

The tables present weights in particular regions.

## Rules for selection of agricultural holdings

The FADN survey is carried out mainly by the agency of the so-called accounting offices. They are centres of agricultural consulting or regional centres of consulting on development of agriculture and rural areas. In total, there are 26 accounting offices in Poland. The survey is supervised by IAEFE.

The agricultural holdings were selected through finding appropriate agricultural holdings by the employees of the accounting offices.

They were supplied with questionnaire forms, which made it possible to calculate (after entering the data in computer databases and activating of classification algorithm) the economic size unit and agricultural type, and then decide whether the surveyed agricultural holding was suitable for FADN survey.

In view of necessity to simplify the farm selection procedures, it has been decided to aggregate some stratum.

---

First of all, classes ES 2 and ES 3, as well as classes ES 4, 5 and 6 in all types of farming has been brought together. In particular regions, classes within types have been aggregated starting from ES 9 in view of the low amount of farms in single classes of observation field.

In schedules with the quantities and structure of sample, all the aggregations have been marked using double frame.

## **Final remarks**

The presented plan of the selection of a sample of agricultural holdings entered into force in the accounting year 2004.

The plan will be updated in the accounting year 2006. The SGM“2002” coefficients will be then used for classification of agricultural holdings.

Regardless of that, every year a part of agricultural holdings in the sample will be exchanged so that the plan of selection could be accomplished in the best way.
